

ABSTRACT OF THE DISCLOSURE

37 C.F.R. § 1.77(b)(10)

5

A method and device for treating patients with sensory integration disorder is provided which comprises the steps of providing a platform that is rotatably connected to a base; placing a patient on the rotating platform in a first specified position; spinning the patient in one direction at a desired rotational speed; then spinning the patient in the opposite direction at a desired rotational speed. The method can include placing the patient in several different specified positions followed by spinning first in a clockwise and then in a counterclockwise direction. The method is repeated as required by the patient, based on the recommendations of a qualified occupational therapist.
